Suction Filter ES 074

Conversion instructions for use of filter elements of the successor series ES 075

Description

As part of the revision of the suction filters ES 074, the filter elements also have been modified. The elements of the new filter series are fully backwards compatible and can easily be used in the previous housing designs by a minor modification of the filter cover. As with the element change, only the poppet must be unscrewed and the filter element must be removed from the rod. Subsequently, the rod can be unscrewed from the cover. After successful disassembly, the rod and foot valve can be disposed of (see fig. 4 of the following conversion instructions).

Please use suitable tools for the conversion.

The by ARGO-HYTOS assured functions of the complete filters as well as the outstanding features of the filter elements can only be guaranteed if ARGO-HYTOS spare parts are used.
